(54) Abstract Title
A mobile chassis for an invalid hoist

(57) The mobile chassis comprises two elongate chassis side members 11 which extend in parallel or substantially parallel spaced apart relationship. Each chassis side member includes a drive wheel 17, a motor 19 for rotating the drive wheel, and a driven wheel 18. The drive wheel is rotatable about an axis extending parallel or substantially parallel to the longitudinal extent of the side member. The driven wheel is rotatable about an axis extending perpendicularly or substantially perpendicularly to the longitudinal extent of the side member. The wheels 18 and 19 of each side member are movable relative to one another between a first position in which the wheels engage one another so that rotation of the drive wheel will cause the driven wheel to rotate to move the chassis along the ground and a second position in which the two wheels are out of engagement with one another.

At least one drawing originally filed was informal and the print reproduced here is taken from a later filed formal copy.
The claims were filed later than the filing date but within the period prescribed by Rule 25(1) of the Patents Rules 1995.
